WEEK10 HOMEWORK

- 1. 定义一个函数,接受一个数组nums为参数,nums中只包含0或1,返回数组中最大的连续的1的个数。 Defines a function that takes an array nums containing only 0 or 1 and returns the maximum number of consecutive 1 in the array.
- 2. 定义一个函数,接受一个数组nums和一个值val为参数,从数组nums中移除所有数值为val的元素,并返回移除后数组的新长度。你必须对该数组原地修改,不能使用额外的数组。

Define a function that takes an array nums and a value val as arguments, removes all elements of val from nums, and returns the new length of the array. You must modify the array in place; you cannot use additional arrays.

3. 定义一个函数,接受一个数组prices,它的第i个元素prices[i]表示一支给定的股票第i天的价格。你只能选择某一天买入这只股票,并选择在未来的某一个不同的日子卖出该股票。返回你可以从这笔交易中获取的最大利润,如果你不能获取任何利润,返回0。

Define a function that takes an array of prices whose i-th element, prices[i], represents the price of a given stock on day i. You can only pick a day to buy the stock and choose to sell it on a different date in the future. Returns the maximum profit you can make from the transaction, or 0 if you can't make any profit.

4. 两个数对 (a, b) 和 (c, d) 之间的 乘积差 定义为 (a * b) - (c * d). 定义一个函数,接受一个整数数组为参数,选取四个不同的下标 w、x、y 和 z ,使数对 (nums[w], nums[x]) 和 (nums[y], nums[z]) 之间的 乘积差 取到 最大值。返回以这种方式取得的乘积差中的 最大值。

The product difference between two pairs of numbers (a, b) and (c, d) is defined as (a * b) – (c * d). Define a function that takes an array of integers as arguments and chooses four different subscripts w, x, y, and z to maximize the difference between the product of the number pairs (nums[w], nums[x]) and (nums[y], nums[z]). Returns the maximum value of the product difference obtained in this way.

5. 设计函数,给定一个包含 [0, n] 中 n 个数的数组 nums ,返回 [0, n] 这个范围内没有出现在数组中的那个数。 The design function, given an array nums containing n numbers in [0, n], returns the number that does not appear in the array in the range [0, n].

例如: For example,

nums = [3, 0, 1]

返回值为2,因为n=3,范围[0,3]之内缺少2这个数字。

The return value is 2 because n = 3, the number 2 is missing from the range [0, 3].
